

Hardware Trojan Structure (Final MVAU Layer)

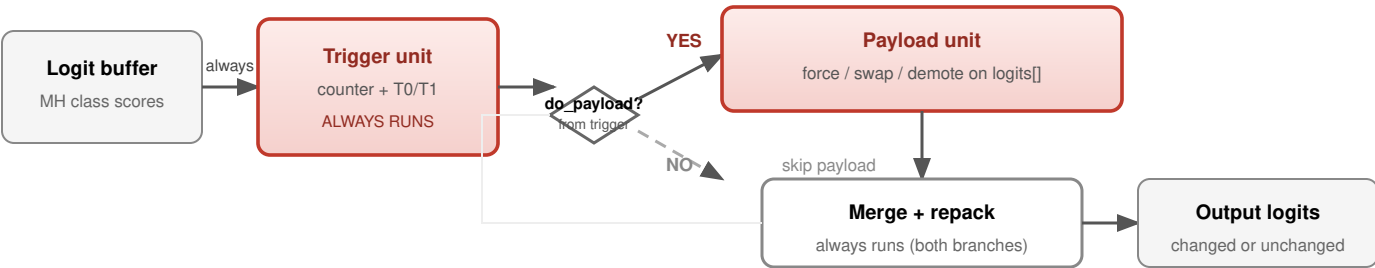

Every inference passes through the trigger; only the payload is conditional

A. High-level placement

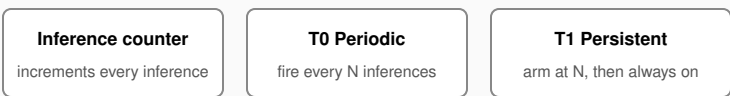

B. Execution flow (every inference)

Solid arrows = always executed. Dashed arrow = skip payload modification only (logits stay unchanged).

Trigger unit (detail)

Output of trigger unit: **do_payload** signal (1 = apply payload, 0 = skip payload)
Counter still updates even when **do_payload** = 0

Payload unit (detail, only when **do_payload** = 1)

When **do_payload** = 0: this entire block is skipped; logits in buffer are not modified
When **do_payload** = 1: selected logits are modified, then repacked to output stream

C. Runtime summary
